Schubert calculus and Gelfand-Zetlin polytopes (joint work with Valentina Kiritchenko and Vladlen Timorin)

Evgeny Smirnov

Higher School of Economics Department of Mathematics

Laboratoire J.-V. Poncelet Moscow, Russia

ICRA XIV, Tokyo, August 12, 2010

Outline

Motivation: toric varieties

- Toric varieties and polytopes: a dictionary
- Pukhlikov–Khovanskii ring

Definitions

- Schubert varieties and Demazure modules
- Gelfand–Zetlin polytopes

Main results

- Representing Schubert classes by faces of GZ-polytopes
- Example of computation in H[∗](GL₃/B, ℤ)

Polarized projective toric varieties

- $T = (\mathbb{C}^*)^n \xrightarrow{\varphi} X \hookrightarrow \mathbb{P}^N$ X normal, Im φ dense in X
- integral polytope $P \subset \mathbb{R}^n$, $\#(P \cap \mathbb{Z}^n) = N + 1$
- -dimensional T-orbits in $X \leftrightarrow k$ -dimensional faces of

 \leftrightarrow

X is smooth \leftrightarrow

P is integrally simple (in each vertex, the primitive vectors form a basis of \mathbb{Z}^n)

product in $H^*(X, \mathbb{Z})$ (for X smooth) intersection of faces of P

Evgeny Smirnov (HSE & Labo Poncelet)

Schubert varieties: definitions

- G = GL(V), dim V = n;
- $B \subset G$ the group of upper-triangular matrices;
- G/B full flag variety;
- $G/B = \bigsqcup_{w \in S_n} BwB/B$ Schubert decomposition;
- $X_w = \overline{BwB/B}$ Schubert varieties;
- X_w have many important properties; in particular, the Schubert cycles [X_w] form a basis in H^{*}(G/B, ℤ).

Main problem of Schubert calculus

How to describe the multiplication in $H^*(G/B, \mathbb{Z})$?

$$[X_V] \cdot [X_W] = \sum C_{VW}^U [X_U]; \qquad C_{VW}^U = ?$$

(*c*^{*U*}_{*vw*} are called *Littlewood–Richardson coefficients*.)

Schubert varieties: definitions

- G = GL(V), dim V = n;
- $B \subset G$ the group of upper-triangular matrices;
- *G*/*B* full flag variety;
- $G/B = \bigsqcup_{w \in S_n} BwB/B$ Schubert decomposition;
- $X_w = \overline{BwB/B}$ Schubert varieties;
- X_w have many important properties; in particular, the Schubert cycles [X_w] form a basis in H^{*}(G/B, ℤ).

Main problem of Schubert calculus

How to describe the multiplication in $H^*(G/B, \mathbb{Z})$?

$$[X_v] \cdot [X_w] = \sum c^u_{vw}[X_u]; \qquad c^u_{vw} = ?$$

(c^u_{vw} are called Littlewood–Richardson coefficients.)

- For toric varieties, products in H^{*}(X_P, ℤ) can be computed by intersecting faces in P.
- Goal: compute products in R_{GZ} ≃ H^{*}(G/B, Z) by intersecting faces of GZ(λ).
- Problem: $GZ(\lambda)$ is not simple.
- Solution: define an *R_{GZ}*-module

$$M_{GZ} = \langle [\Gamma_i] | \Gamma$$
 is a face of $GZ \rangle / (relations)$,

such that

$$R_{GZ} \hookrightarrow M_{GZ}$$
.

Main results

• There is a combinatorial procedure mapping *certain* faces of the GZ-polytope (called *rc-faces*) to permutations:

 $\Gamma \mapsto w(\Gamma) \in S_n.$

Theorem

The following identities hold in M_{GZ} :

$$[X_w] = \sum_{w(\Gamma)=w} [\Gamma],$$

where the sum is taken over all rc-faces corresponding to $w \in S_n$.

Remark

This theorem is formally equivalent to (but not implied by) the theorem of Fomin and An. Kirillov on Schubert polynomials and "pipe dreams" (1994).

Evgeny Smirnov (HSE & Labo Poncelet)

Theorem

Under the projection π : $GZ(\lambda) \rightarrow wt(V(\lambda))$,

$$\sum_{\substack{x \in \bigcup \\ w(\Gamma)=w}} \operatorname{F} \cap \mathbb{Z}^{n(n-1)/2} \exp \pi(x) = ch \, D_w(\lambda).$$

Remark

This generalizes a result of Postnikov and Stanley (2009), who showed this for 312-avoiding permutations.
